

(a) pT paths on the Fisher sphere  $x = 2\sqrt{p}$   
(PCA, 93% of spread; clouds = posteriors)

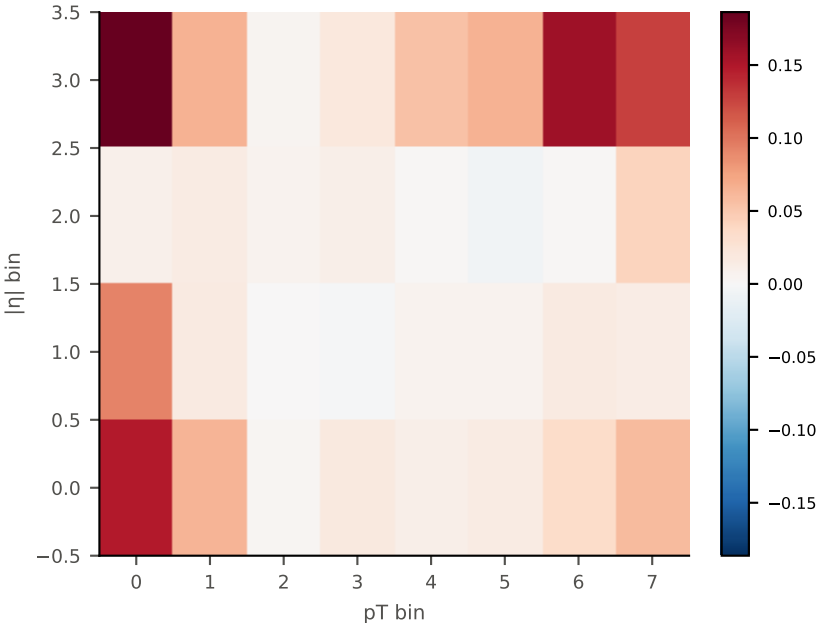

(b) the path bends in every connection

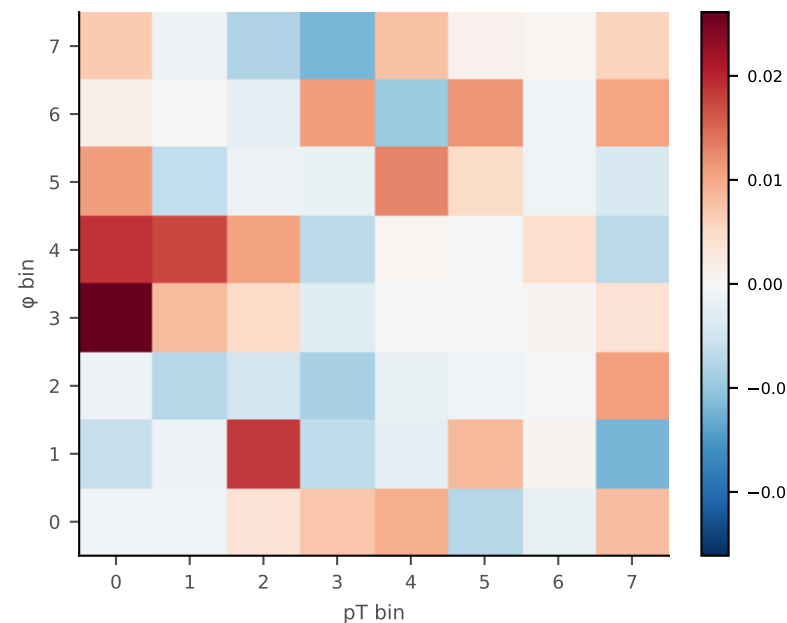

(c) curvature = how much the error bar wobbles  
(dotted: Efron-Hinkley prediction  $\gamma^2_e$ )

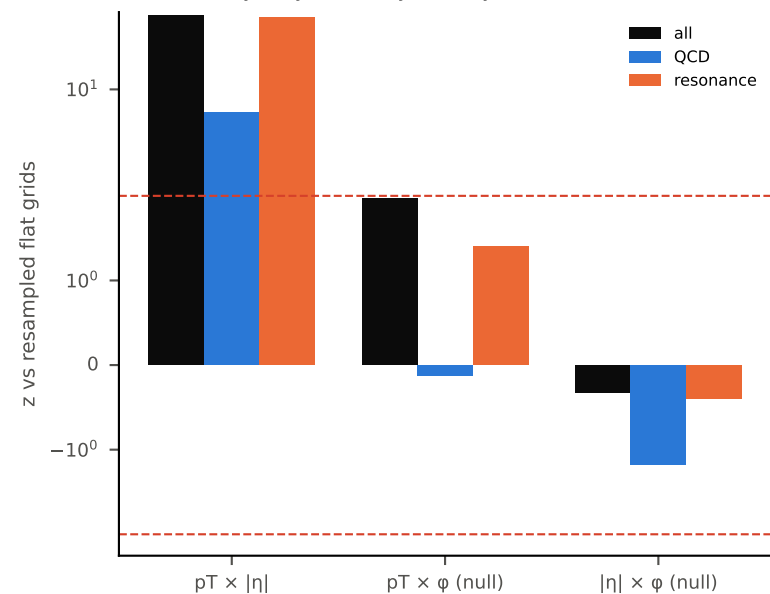

(d) where flat transport fails, all jets (1e-3 nats/jet)  
excess  $1.26 \pm 0.04$ ,  $z$  30.6

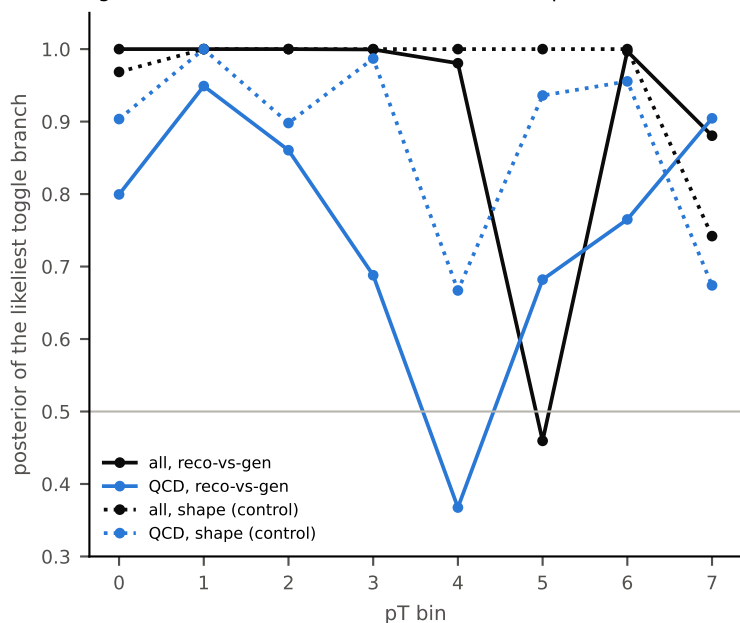

(e) where flat transport fails, all jets (1e-3 nats/jet)  
excess  $0.12 \pm 0.06$ ,  $z$  2.0

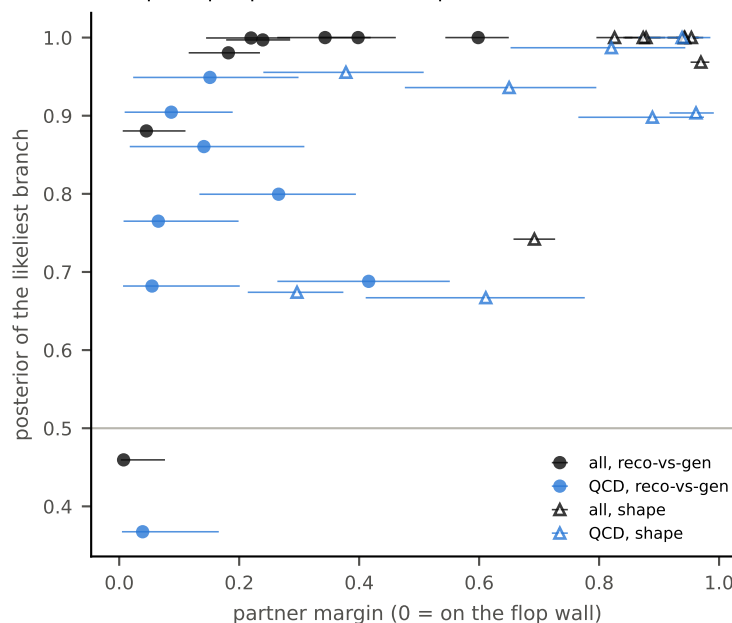

(f) holonomy only where symmetry allows it

(g) near a node the branch is uncertain (flop)

(h) branch certainty is set by distance to the wall  
(one point per pT bin; bars 90% posterior)

(i) information only the 4-way joint carries  
(bands 90% posterior; QCD band omitted:  $\pm 0.5$ )
