(a) Critical values: the signed object's value dominates below the wall, the barycentre's above; their sizes cross at $\alpha = 1/3$
outcome wall
real-signed
positive
complex
$\log_{10} |W(\text{crit})|$ at $T = 10^{-24}$

(b) Mutations happen at Stokes walls; for every phase they converge to the outcome wall, linearly in $1/\log(1/T)$
outcome wall $\alpha = 1/3$
Stokes walls, phase $\theta = 0.3$
Stokes walls, phase $\theta = 1$
Stokes walls, phase $\theta = 1.6$
α at which two critical values align
$1/\log(1/T)$
