(a) the tangent structure on a hiding sheet:
the worst case sits at a vertex, the cone decides
worst case 0.0511:
∇F · u ≥ 0 on the cone
x = log λ
y = log t
(b) one chord, decided exactly: a hole (red) and
genuine act changes (orange) as roots of degree-6 polynomials
domain polynomial (cube root)
decision r̂ − r_c
sgn(q)|q|^1/3 (domain: q > 0)
r̂ − r_c (act T where > 0)
share ε of Q
(c) globally, pooling fails by leaving the domain
(the pooled covariances take the odd sign class), not by flipping
anywhere (Dirichlet)
near truth, sd 0.06
near truth, sd 0.02
share of same-act pairs (150 each)
safe
flip inside the domain
leaves the domain
