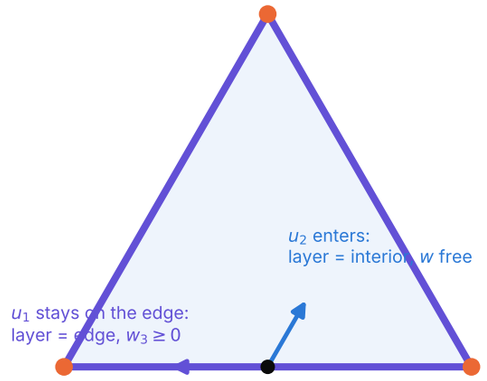
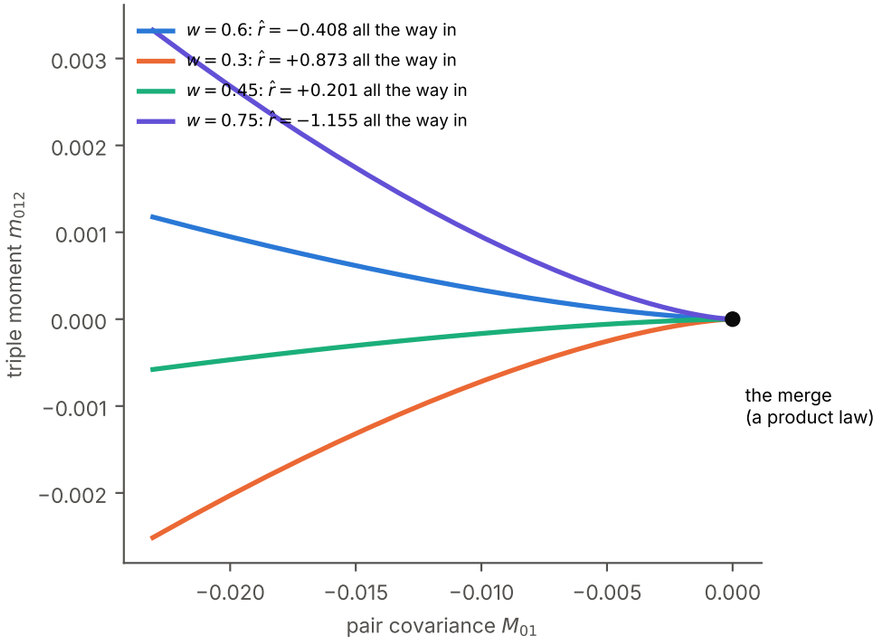
(a) layer 1: strata, and the layer a direction enters

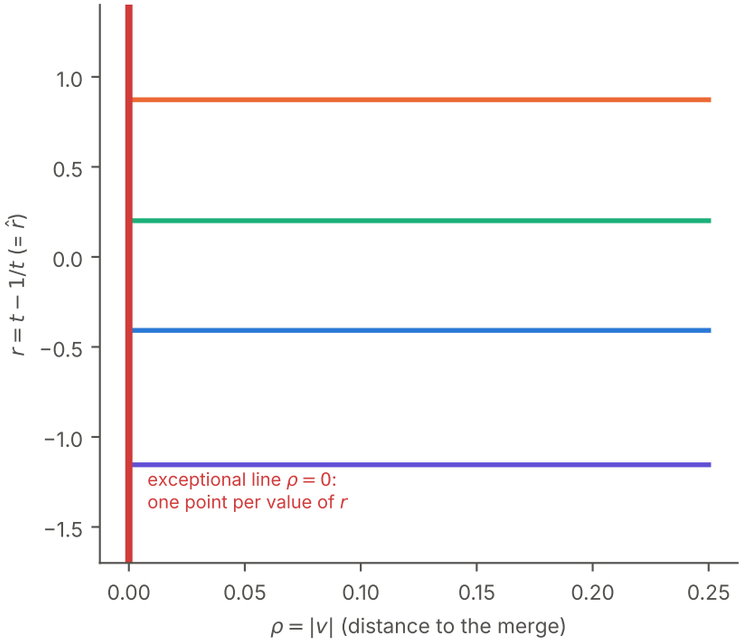


strata: 3 vertices (orange), 3 open edges (violet), the open interior (blue).
Each open stratum is a tangent category; the corner fibre (29 points)
= 15 (edge layer) + 14 (interior layer), not 5 × 5 = 25

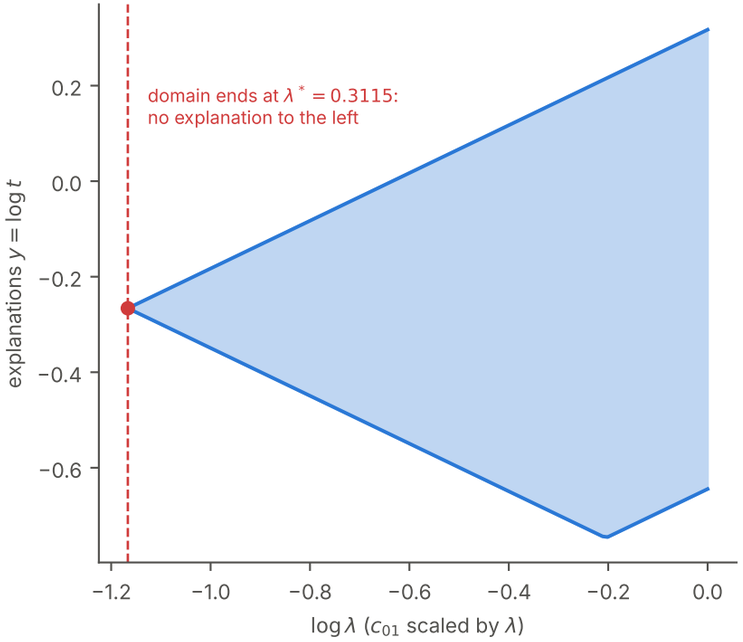
(b) layer 2, downstairs: families entering one law
keep different $\hat{r}$; no limit at the merge



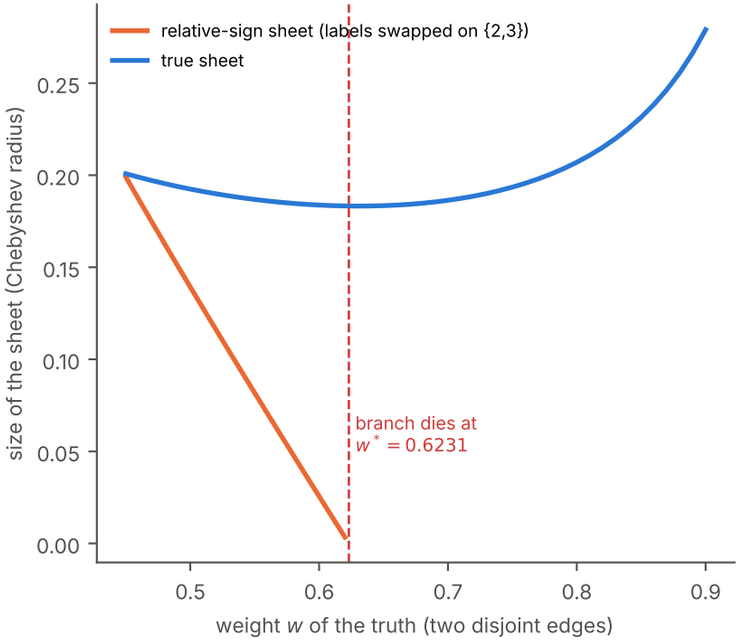
(c) layer 2, upstairs: blown up, $\hat{r}$ is a smooth
coordinate; the singular point became a line

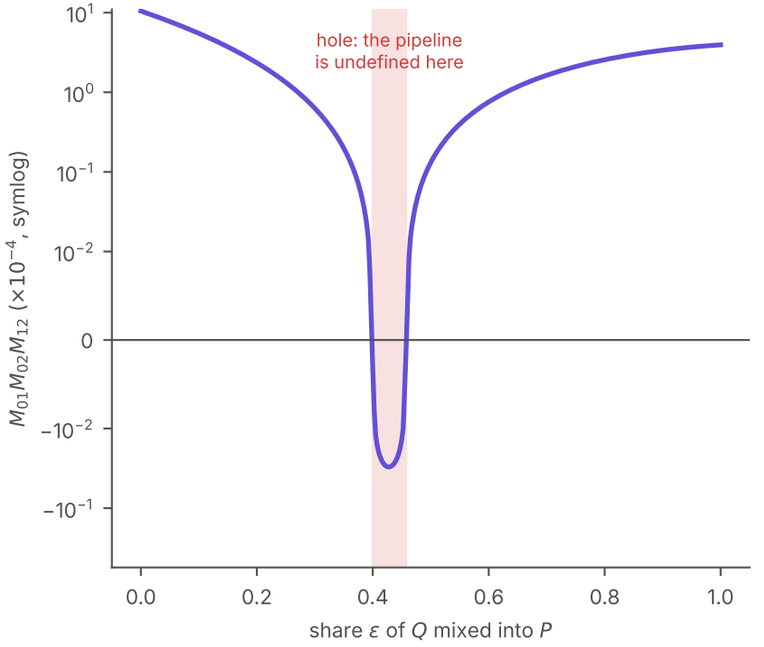


(d) layer 3: the multi-map data → explanations
has a corner where its domain ends



(e) layer 3: a branch of the multi-map
ends at a positivity wall





(f) restriction criteria do not mix: both laws are
in the domain, part of the chord is not
