(a) the latent moment space: two types are its lower boundary; the trinomial is that boundary
$M_4 = E\tau^4$ (a four-window)
$M_3 = E\tau^3$ (a triple window)
M_4 free given M_3 for three types
truth
three or more collinear types
two types: $M_4 = M_3^2 + 1$ (Hankel $= 0$)
(b) dimensions along the window ladder ($m = 5$)
dimension of the hiding set
three types, general (17 parameters)
two types
three collinear types (sizes 3, 4, 5 remove one each: 3, 2, 1, 0)
S_3 descent: one four-window has a 1-dim fibre; two overlapping ones glue to a point (17 of 17)
pairs
+1 triple
+2
+3
+4
all triples
full table
(c) decision ranges (truth: two types): E3 = all of 0,1,2 harmed, E4 = all of 0..3; with the triple 012, E4 is pinned only for two types
E3 | pairs
E3 | +triple
E4 | pairs
E4 | +triple
two types
three collinear (exact)
three general (inner bound)
probability of the event
