(a) F_1 with $\alpha = 0.2$: one candidate, and a signed critical point off it
leading terms balance (candidates)
critical point: real, $y_1 < 0$
critical point: positive
critical point: complex
$p_2 \le 1 - \alpha$
$p_2 \ge 0$
u_1
u_2
(b) F_1 with $\alpha = 0.6$: a segment of candidates; higher order selects one point
leading terms balance (candidates)
endpoints: no positive balance
critical point: real, $y_1 < 0$
critical point: positive
critical point: complex
$p_2 \le 1 - \alpha$
$p_2 \ge 0$
u_1
u_2
(c) F_1, $\alpha = 0.6$: the thimble law with $\hbar = T^h$; its support shrinks to $u_1^* = 0.4$ as h grows
$h = 0$ (uniform on Q)
$h = 0.2 = h^*$ (the segment)
$h = 0.3$ (next level)
$h = 0.45$ (at u^*)
density of the u_1-marginal
$u_1 = \log y_1 / \log T$
