Step 1
probability monad $\mathcal{D}$
laws, kernels, mixtures (η, μ)
λ
Step 1
provenance comonad $W = L \times (-)$
source labels (ε, δ)
Step 2
tangent structure T
feasible directions at the boundary
Step 3
orders of transitions
ord: germs $\to (\min, +)$
at which order a transition is seen
marginalisation: total, affine
forgetting provenance = marginalising over L
Steps 4-5: fans, decisions, Theorem J, graded classes, duality and logs
conditioning: partial, nonlinear; contextual Bayes reweights the sources
