(a) the refinement tree of $(y - x - x^2)^2$ against x^5

level 0: cells in (x, y)
edge $w = 1$ of $P(A)$, root $c^* = 1$ (double)

↓

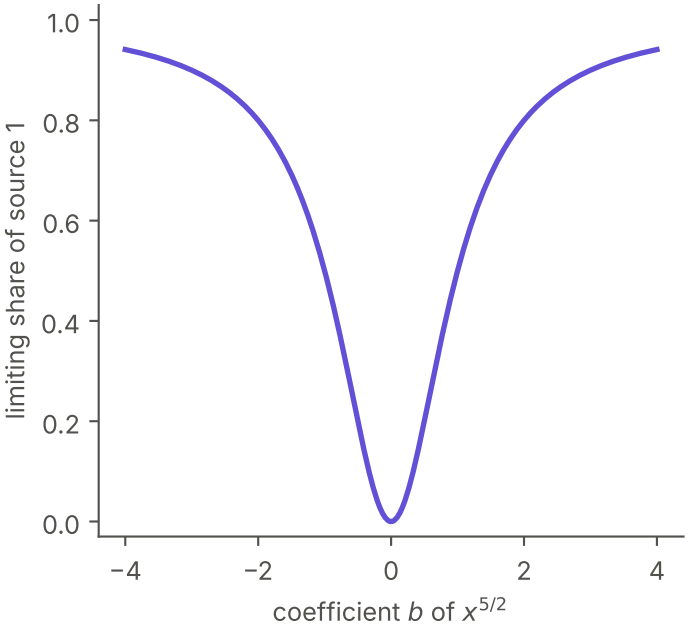
level 1: $y = x(1 + y_1)$, $x = t$
edge $w = 1$, root $c^* = 1$ (double)

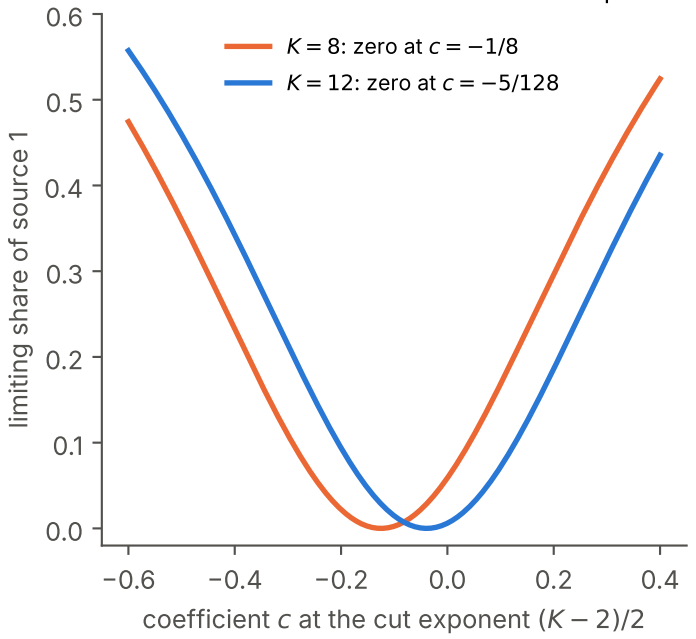
↓

level 2: $y_1 = t(1 + y_2)$
non-degenerate: cones and a ray $w = \frac{1}{2}$

limits: 1 (leave early), $\frac{b^2}{1+b^2}$ on $y = x + x^2 + bx^{5/2}$,
0 (leave late or follow $y = x + x^2$ exactly)

(b) the limit map at the bottom node





(c) $(y^2 - x^2 - x^3)^2$ against x^K: the root's coefficient is the zero of the limit map
