(a) the event's probability changes gradually
gap $\eta = 0.1$
gap $\eta = 0.025$
gap $\eta = 0.01$
$\eta = 0$ (touches the wall)
$P_t(A)$
time $t$
(b) which source explains $A$: gradual, then sudden; a jump at $\eta = 0$
width $4\eta$, slope $-1/(4\eta)$
posterior weight of source 1, $\pi_1^A$
time $t$
(c) source extinction: the weight fades continuously, the source's own conditional has no limit
source 1's own $C_A(p_1)(a)$
its posterior weight $\pi_1^A$
$t \to 0$ (log scale)
