
(a) sources reaching the wall at orders m_l: the lowest order survives (here 2/3, 1/3)
posterior weight $\pi_l^A(s)$
$m_l = 1$, survives
$m_l = 1$, survives
$m_l = 1.5$, extinct at order 0.5
$m_l = 2$, extinct at order 1
$s = t - t^* \to 0$
(b) same gap $\eta = 0.01$: a higher-order approach switches more gradually (width $2(2\eta)^{1/m}$)
π_1^A
order $m = 1$
order $m = 2$
order $m = 3$
time t
(c) flat approaches: comparable germs have a limit, oscillating ones need not
share of the first cell
$e^{-1/s}(1 + \sin\frac{1}{s})$ against $e^{-1/s}$: no limit
$e^{-1/s}/\log\frac{1}{s}$ against $e^{-1/s}$: limit 0
$s \to 0$ (every derivative vanishes)
