(a) the decision fan of the race; each study design fills exactly one cone (hatched)
ray $t = cs$: audit 1 iff $c \geq 1$ ($c = 1$: tie at the limit, broken at order 3)
audit source 2 = the cone of design 1 $w = (w_s,\ w_s + w_u)$
audit source 1 = the cone of design 2 $w = (w_u + w_v,\ w_u)$
weight w_t (share $t \to 0$)
weight w_s (event rate $s \to 0$)
0.0

(b) the parameter plane: each design keeps its routes to the corner on one side of the decision wall
design 2: $s = u\,v$, $t = u$ (lines of fixed v)
wall $\pi_1^A = \frac{1}{2}$
design 1: $t = s\,u$ (lines of fixed u)
$\log_{10} t$
$\log_{10} s$
