(a) one picture: chambers, model part, two walls
positivity part of the pair line (laws with the pair tables)
model part M (hiding segment)
chamber: approve the triple (T)
chamber: approve the pair (P)
margin 0.001
truth
decision wall P(001) = 0.128
detection walls (ends of M)

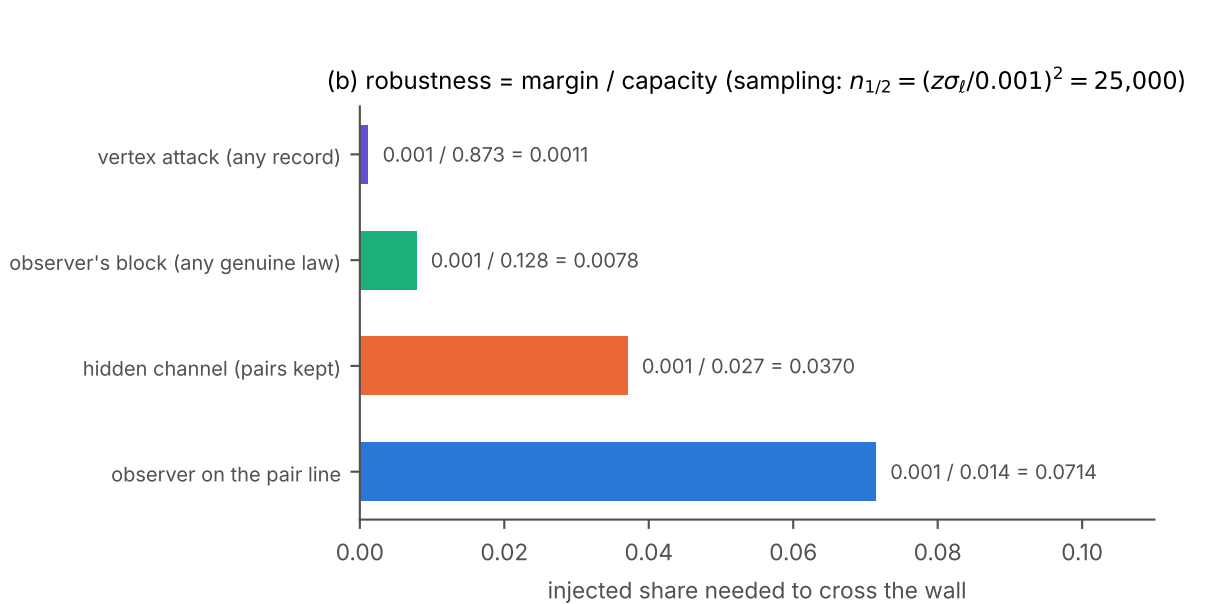
triple harm along the pair line (0.667 + s)



(b) robustness = margin / capacity (sampling: $n_{1/2} = (z\sigma_\ell/0.001)^2 = 25{,}000$)
vertex attack (any record)
0.001 / 0.873 = 0.0011
observer's block (any genuine law)
0.001 / 0.128 = 0.0078
hidden channel (pairs kept)
0.001 / 0.027 = 0.0370
observer on the pair line
0.001 / 0.014 = 0.0714
