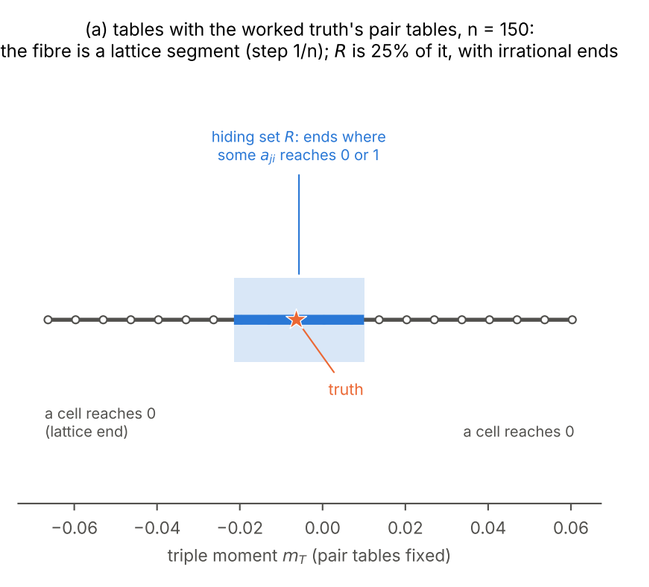
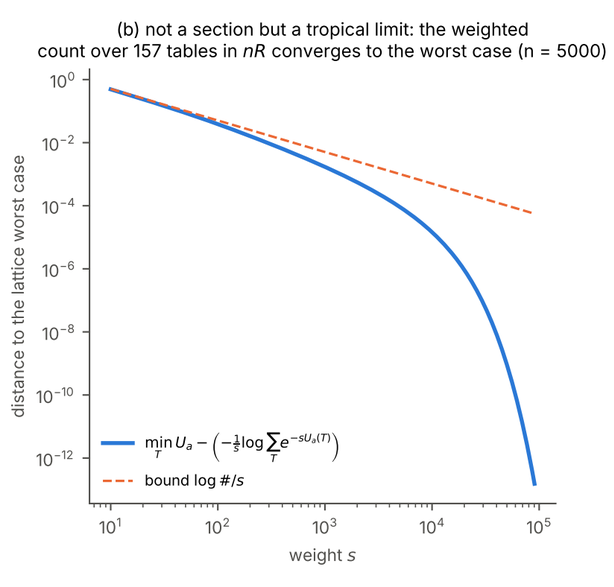
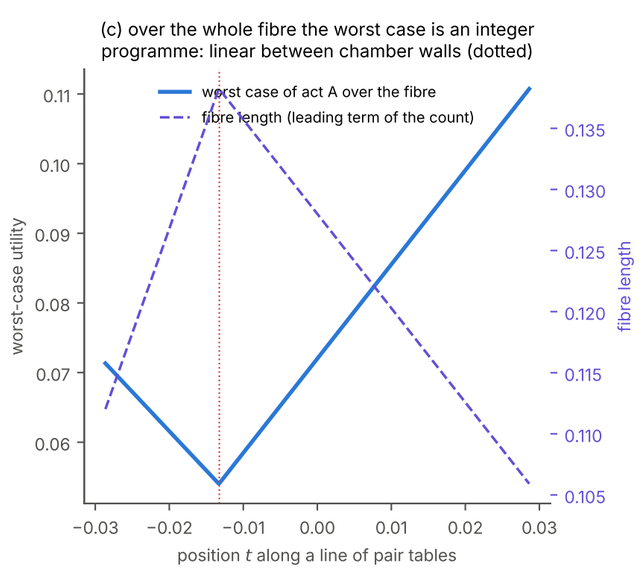
(a) tables with the worked truth's pair tables, n = 150:
the fibre is a lattice segment (step 1/n); *R* is 25% of it, with irrational ends

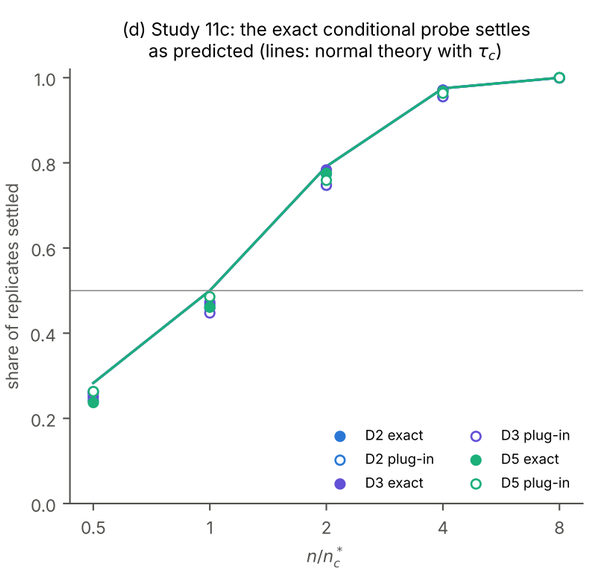


(b) not a section but a tropical limit: the weighted
count over 157 tables in *nR* converges to the worst case (n = 5000)



(c) over the whole fibre the worst case is an integer
programme: linear between chamber walls (dotted)





(d) Study 11c: the exact conditional probe settles
as predicted (lines: normal theory with τ_c)
