(a) the hidden channel: $\hat{r}$ walks along the segment;
shaded: decision taken over, nothing flagged
$\varepsilon_{1/2} = 0.058$
(N = 10^5)
$\varepsilon_{det} = 0.164$
$\varepsilon^* = 0.071$
regulator's hiding segment R (unchanged)
$\hat{r}$ under injection: $r_0 + \varepsilon s / v_T$
switch point: treat A = flat act C
r
injected share ε (whole records, pair tables untouched)
(b) Study 12 (H1-H3): the decision flips near 6% injection;
detection starts near 15%
share choosing the genuine act A: predicted
observed
share flagged: predicted
observed
share of replicates
injected share ε
(c) m = 4: the stealth-tilt frontier is concave and piecewise linear;
invisibility costs about 6% of the tilt here
best first-order tilt of $\hat{r}$ at that visibility
stealth law (tetrads blind): tilt 10.1
vertex law (point mass): tilt 10.7
first-order tilt $d\hat{r}/d\varepsilon$
first-order tetrad displacement per unit ε (noise units)
(d) Study 12 (H4): equal tilt, opposite fate;
the stealth law stays at the test's level
predicted
stealth: observed
vertex: observed
tetrad test rejection rate (level 0.05)
N = 2000
N = 10000
N = 50000
