(a) the adversarial lift: block of explanations reaches the other chamber
any genuine law (unconstrained Q)
keeping the pair tables (the line)
chamber wall P(001) = 0.128
1/128
1/14
largest genuine P′(001) in the block
injected share ε the decision maker allows
(b) dilation: the population is pinned, the individual is not
P(C) = 0.28: a point
no profile
A,B = 0,0
width 0.212
width 0.030
width 0.039
width 0.018
forecast of C (interval: pair tables only; dot: with the triple)
(c) the value of a probe in its size (Bayes)
flat start
optimum n = 18400
EVSI(n)
cost 10⁻⁹n
net value
value (×10⁻⁵ utility)
triple records n in the probe
(d) backtracking: being caught late is free unless the past is revoked
forward-only: accepted sections are final
backtracking: late failures revoke
final pooled shift (pooled se)
adversary's dose per batch (batch sd), all 8 rounds
