(a) Theorem H: the adversary's segment and the regulator's are two parts of one line;
the decision boundary is nearer than the detection boundary (design D2)
wall
detection boundary
(wall on the pushed side)
injection moves
m_T by εs
truth
decision boundary r_c
positivity part: all laws with these pair tables (adversary)
model part: the regulator's hiding segment $v_T R$
−0.06

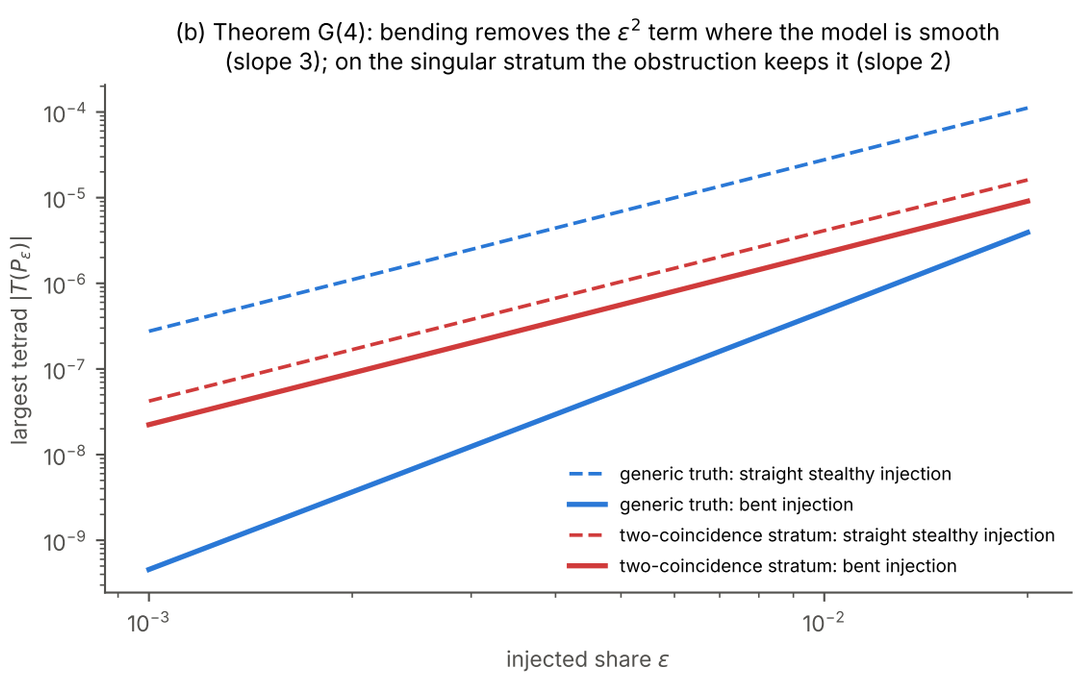
−0.02
0.00
0.02
0.04
triple moment m_T (the regulator reads $r = m_T/v_T$)



(b) Theorem G(4): bending removes the ε^2 term where the model is smooth
(slope 3); on the singular stratum the obstruction keeps it (slope 2)
largest tetrad $|T(P_\varepsilon)|$
