Observe
windows and tables
(the sheaf revealed so far)
Orient
the latent fibre: a segment under
pair tables; strata $v_i = 0$
tempo: 0 (pairs only), $n^{-1/2}$ (after a triple),
$n^{-1/4}$ for the merge (Thm B)
Act
run the treatment or the probe;
its outcome is a new window
Decide
robust act, and which probe:
$\arg\max_S |\hat{V}_S|$ (Thm C)
