(a) bands of the apparent triple harm: 95% of replicates (shaded; dotted: genuine), median (line)
genuine (A0), filter
sometimes adversarial (A1b), filter
fixed share (A2), pooling
fixed share (A2), filter
switch 0.668
truth 0.667

(c) paths of the gluing statistic: just enough rides flat under c_s; a fixed share grows like $\sqrt{N}$
A0: genuine
A1: sometimes, risk 0.2
A1b: sometimes, risk 0.5
A2: fixed share
source C's gluing statistic Z_C (mean ± 1)
c_s = 2.39

(d) the filter turns a tilt into a bounded delay
pooling under A2: tilted
gluing filter, worst adversary
gluing filter under A1b: still open (delay)
share of replicates
