(a) three tempos: 0, $n^{-1/2}$, $n^{-1/4}$ (dotted guides)
error / width
samples per window n
r after one triple (G) slope -0.51
width of the segment, pairs only (G) slope 0
v_3 at agreement (A) slope -0.51
$\|v\|$ at the merge (M) slope -0.25
(b) the merge answers like $\sqrt{s}$; agreement on one variable is regular (exponent 1)
response of the fitted actors
perturbation of the pair moments s
G: exponent 1.00
D: exponent 1.00
A: exponent 1.00
M: exponent 0.50
(c) calibrated null and the detection rule
200 generic truths (null)
G
A
D
M
detection rule 0.75
response exponent
