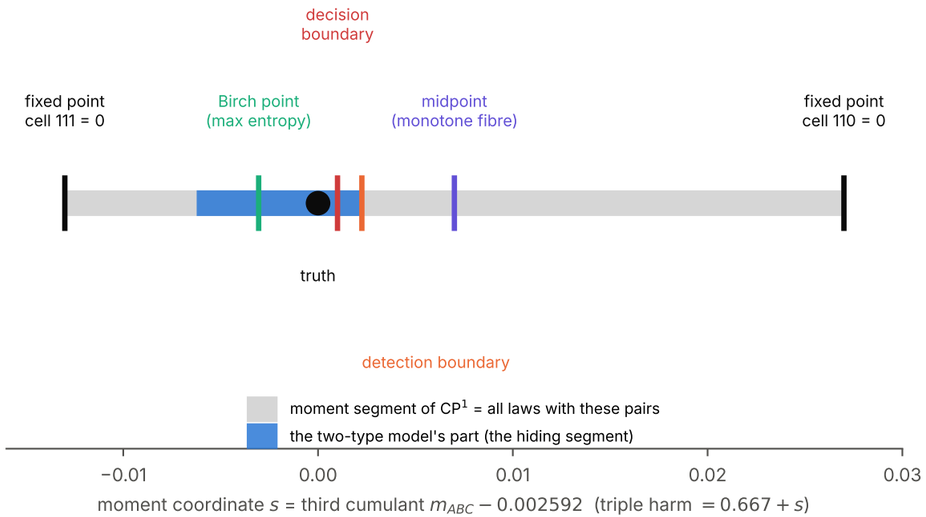
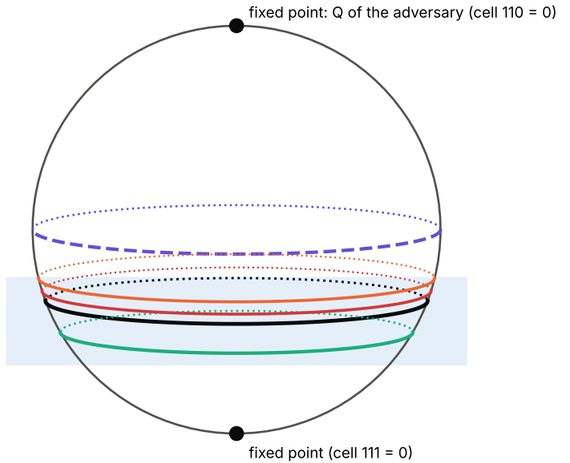
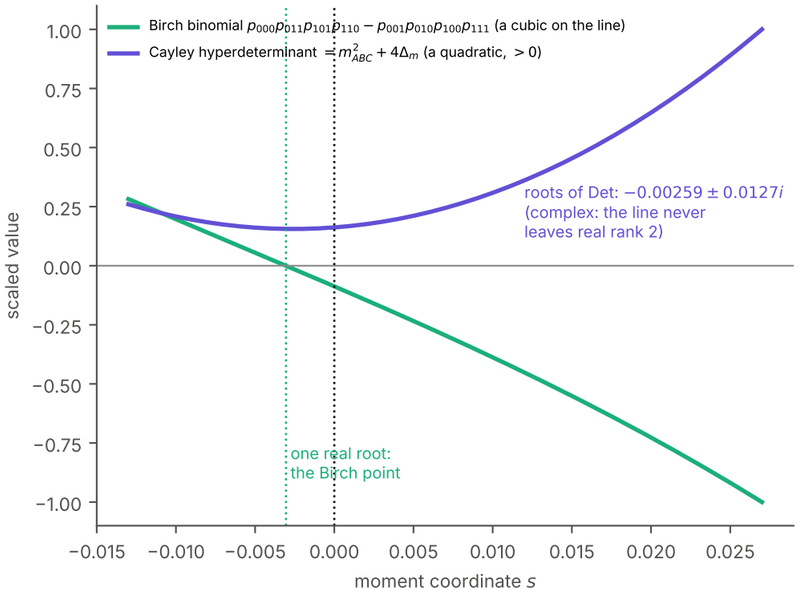
(a) the boundary fibre is a Delzant segment of lattice length 0.040;
its facet values at the truth, 0.027 and 0.013, are the channel capacities



(b) CP^1: each law with these pairs is a circle;
height is the moment map; the blue band is the hiding segment





(c) two hypersurfaces met by the line: the no-three-way model
(once, Birch) and the hyperdeterminant (only at complex points)
